GSERM 2017

Regression III Generalized Linear Models I

June 22, 2017 (afternoon session)

The Exponential Family

$$f(z|\psi) = \Pr(Z = z|\psi)$$

Exponential if:

$$f(z|\psi) = r(z)s(\psi)\exp[q(z)h(\psi)]$$

provided that r(z) > 0 and $s(\psi) > 0$.

$$f(z|\psi) = \exp[\underbrace{\ln r(z) + \ln s(\psi)}_{\text{"additive"}} + \underbrace{q(z)h(\psi)}_{\text{"interactive"}}]$$

Canonical Forms

$$y = q(z)$$
 $heta = h(\psi)$ $f[y|\theta] = \exp[y\theta - b(\theta) + c(y)].$

- $b(\theta)$ is a "normalizing constant"
- c(y) is a function solely of y
- ullet y heta is a multiplicative term

A Familiar Family Member: Poisson

$$f(y|\lambda) = \frac{\exp(-\lambda)\lambda^y}{y!}.$$

$$f(y|\lambda) = \exp \left\{ \ln \left[\exp(-\lambda) \lambda^{y} / y! \right] \right\}$$
$$= \exp \left[\underbrace{y \ln(\lambda)}_{y\theta} - \underbrace{\lambda}_{b(\theta)} - \underbrace{\ln(y!)}_{c(y)} \right]$$

Family Nuisances

$$f(y|\theta,\phi) = \exp\left[\frac{y\theta - b(\theta)}{a(\phi)} + c(y,\phi)\right]$$

Familiar Family Member II: Normal

$$f(y|\mu, \sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left[\frac{(y-\mu)^2}{2\sigma^2}\right]$$

$$f(y|\mu, \sigma^2) = \exp\left[-\frac{1}{2}\ln(2\pi\sigma^2) - \frac{1}{2\sigma^2}(y^2 - 2y\mu + \mu^2)\right]$$

$$= \exp\left[-\frac{1}{2}\ln(2\pi\sigma^2) - \frac{1}{2\sigma^2}y^2 + \frac{1}{2\sigma^2}2y\mu - \frac{1}{2\sigma^2}\mu^2\right]$$

$$= \exp\left[\frac{y\mu}{\sigma^2} - \frac{\mu^2}{2\sigma^2} - \frac{y^2}{2\sigma^2} - \frac{1}{2}\ln(2\pi\sigma^2)\right]$$

$$= \exp\left\{\frac{y\mu - \frac{\mu^2}{2}}{\sigma^2} + \frac{-1}{2}\left[\frac{y^2}{\sigma^2} + \ln(2\pi\sigma^2)\right]\right\}$$

Normal, continued

$$f(y|\mu,\sigma^2) = \exp\left\{\frac{y\mu - \frac{\mu^2}{2}}{\sigma^2} + \frac{-1}{2}\left[\frac{y^2}{\sigma^2} + \ln(2\pi\sigma^2)\right]\right\}$$

 $\theta = \mu$, so:

•
$$y\theta = y\mu$$

•
$$b(\theta) = \frac{\mu^2}{2}$$

•
$$a(\phi) = \sigma^2$$

•
$$c(y,\phi) = \frac{-1}{2} \left[\frac{y^2}{\sigma^2} + \ln(2\pi\sigma^2) \right]$$

Other Family Members

- Binomial (⊃ Bernoulli; also Multinomial)
- Exponential
- Gamma
- Logarithmic
- Inverse Gaussian
- Negative Binomial
- others...

Little Red Likelihood

$$\ln L(\theta, \phi|y) = \ln f(y|\theta, \phi)
= \ln \left\{ \exp \left[\frac{y\theta - b(\theta)}{a(\phi)} + c(y, \phi) \right] \right\}
= \frac{y\theta - b(\theta)}{a(\phi)} + c(y, \phi)$$

Estimation

$$\begin{array}{cccc} \frac{\partial \ln L(\theta,\phi|y)}{\partial \theta} & \equiv & \mathbf{S} & = & \frac{\partial}{\partial \theta} \left[\frac{y\theta - b(\theta)}{\mathsf{a}(\phi)} + c(y,\phi) \right] \\ & = & \frac{y - \frac{\partial}{\partial \theta} b(\theta)}{\mathsf{a}(\phi)}. \end{array}$$

Among family members:

- **S** is a sufficient statistic for θ .
- E(S) = 0.
- $Var(S) \equiv \mathcal{I}(\theta) = E[(S)^2 | \theta]$

More Estimation

$$\mathsf{E}(\mathsf{Y}) = \frac{\partial}{\partial \theta} b(\theta)$$

and

$$\mathsf{Var}(Y) = \mathsf{a}(\phi) \frac{\partial^2}{\partial \theta^2} \mathsf{b}(\theta)$$

Example: Poisson Again

$$E(Y) = \frac{\partial}{\partial \theta} \exp(\theta)$$

$$= \exp(\theta)|_{\theta = \ln(\lambda)}$$

$$= \lambda$$

$$\begin{aligned} \mathsf{Var}(Y) &= 1 \times \frac{\partial^2}{\partial \theta^2} \exp(\theta)|_{\theta = \mathsf{ln}(\lambda)} \\ &= \exp[\mathsf{ln}(\lambda)] \\ &= \lambda \end{aligned}$$

Example: Normal Again

$$E(Y) = \frac{\partial}{\partial \theta} \left(\frac{\theta^2}{2}\right)$$
$$= \theta|_{\theta=\mu}$$
$$= \mu$$

$$Var(Y) = \sigma^2 \times \frac{\partial^2}{\partial \theta^2} \left(\frac{\theta^2}{2}\right)$$
$$= \sigma^2 \times \frac{\partial}{\partial \theta} \theta$$
$$= \sigma^2$$

Linear Model(s)

$$Y_i = \mathbf{X}_i \boldsymbol{\beta} + u_i$$

$$\mathsf{E}(Y_i) \equiv \boldsymbol{\mu}_i = \mathbf{X}_i \boldsymbol{\beta}$$

The "Generalized" Part

$$g(\mu_i) = \mathbf{X}_i \boldsymbol{\beta}.$$

$$\eta_i = \mathbf{X}_i \boldsymbol{\beta} \\
= \mathbf{g}(\boldsymbol{\mu}_i)$$

$$\mu_i = g^{-1}(\eta_i)$$

$$= g^{-1}(\mathbf{X}_i\beta)$$

Random component $\sim \text{EF}(\cdot)$ with

$$\mathsf{E}(Y_i) = \mu_i$$
.

Systematic component:

$$g(\mu_i) = \eta_i$$

"Link function":

$$g(\mu_i) = \eta_i$$

or

$$g^{-1}(\eta_i) = \mu_i.$$

The Return of The Family

$$egin{array}{lll} m{ heta}_i &=& m{g}(m{\mu}_i) \ &=& m{\eta}_i \ &=& m{X}_im{eta} \end{array}$$

$$g^{-1}(\theta_i) = \eta_i$$

GLM Example: Linear-Normal

$$f(y|\mu, \sigma^2) = \mathcal{N}(\mu, \sigma^2)$$
 $\mu_i = \eta_i$
 $\mu_i \equiv \theta_i = \eta_i$
 $Y_i \sim \mathcal{N}(\mu_i, \sigma^2)$

GLM Example: Binary

$$f(y|\pi) = \pi^y (1-\pi)^{1-y}$$
 $extstyle{ heta_i} = \ln\left(rac{\mu_i}{1-\mu_i}
ight)$
 $extstyle{ mu_i} = g^{-1}(heta_i)$
 $extstyle{ mu_i} = rac{\exp(\eta_i)}{1+\exp(\eta_i)}$

 $Y_i \sim \text{Bernoulli}(\mu_i)$

GLM Example: Counts (Independent Events)

$$f(y|\lambda) = \frac{\exp(-\lambda)\lambda^{y}}{y!}$$

$$\ln(\lambda_{i}) = \eta_{i}$$

$$\mu_{i} = g^{-1}(\theta_{i})$$

$$= \exp(\eta_{i})$$

$$Y_{i} \sim \text{Poisson}(\lambda_{i})$$

Common GLM Flavors

Distribution	Range of Y	$Link(s) g(\cdot)$	Inverse Link $g^{-1}(\cdot)$
Normal	$(-\infty, \infty)$	Identity: $\theta = \mu$ (Canonical)	θ
Binomial	{0,n}	Logit: $oldsymbol{ heta} = \operatorname{In}\left(rac{oldsymbol{\mu}}{1-oldsymbol{\mu}} ight)$ (Canonical)	$\frac{\exp(\boldsymbol{\theta})}{1+\exp(\boldsymbol{\theta})}$
		Probit: $\theta = \Phi^{-1}(\mu)$	$\Phi(\boldsymbol{\theta})$
		C-Log-Log: $\boldsymbol{\theta} = \ln[-\ln(1-\boldsymbol{\mu})]$	$1 - \exp[-\exp(\boldsymbol{\theta})]$
Bernoulli	{0,1}	(same as Binomial)	(same as Binomial)
Multinomial	$\{0,J\}$	(same as Binomial)	(same as Binomial)
Poisson	$[0, \infty]$ (integers)	Log: $\theta = ln(\mu)$ (Canonical)	$exp(\boldsymbol{\theta})$
Gamma	(0, ∞)	Reciprocal: $oldsymbol{ heta} = -rac{1}{oldsymbol{\mu}}$ (Canonical)	$-\frac{1}{\theta}$

Note: The Bernoulli is a special case of the Binomial with n=1. The multinomial is the *J*-outcome variant of the Binomial, and is also related to the Poisson (see e.g. Agresti 2002).

GLMs: How-To

- Pick *f*(*Y*)
- Pick $g(\cdot)$
- Specify X
- Estimate

Model Fitting

- MLE
- IRLS (≈ MLE):

$$\hat{\boldsymbol{\beta}}^{(t+1)} = [\mathbf{X}'\mathbf{W}^{(t)}\mathbf{X}]^{-1}\mathbf{X}'\mathbf{W}^{(t)}\mathbf{z}^{(t)}$$

with

$$\mathbf{W}_{N \times N}^{(t)} = \operatorname{diag}\left[\frac{\left(\partial \mu_i^{(t)}/\partial \eta_i^{(t)}\right)^2}{\operatorname{Var}(Y_i)}\right]$$

and

$$\mathbf{z}^{(t)} = \boldsymbol{\eta}^{(t)} + (Y - \boldsymbol{\mu}^{(t)}) \left(\frac{\partial \boldsymbol{\eta}^{(t)}}{\partial \boldsymbol{\mu}} \right).$$

IRLS, Intuitively

At iteration t:

- 1 Calculate $\mathbf{z}^{(t)}$. $\mathbf{W}^{(t)}$
- 2 Regress $\mathbf{z}^{(t)}$ on \mathbf{X} , using $\mathbf{W}^{(t)}$ as weights, to obtain $\hat{\boldsymbol{\beta}}^{(t+1)}$
- 3 Generate $\eta^{(t+1)} = \mathbf{X}\hat{\beta}^{(t+1)}$
- 4 Generate $\mu^{(t+1)} = g^{-1}(\eta^{(t+1)})$
- 5 Use $\eta^{(t+1)}$ and $\mu^{(t+1)}$ to calculate $\mathbf{z}^{(t+1)}$ and $\mathbf{W}^{(t+1)}$
- 6 Repeat until convergence.

Residuals

"Response" Residuals:

$$\hat{u}_{i} = Y_{i} - \hat{\mu}_{i}
= Y_{i} - g^{-1}(\mathbf{X}_{i}\hat{\boldsymbol{\beta}})$$

"Pearson" Residuals:

$$\hat{P}_i = \frac{\hat{u}_i}{[\mathsf{Var}(\hat{u}_i)]^{1/2}}$$

More Residuals

"Deviance":

$$\begin{split} \hat{d}_{i} &= -2[\ln L_{i}(\hat{\theta}) - \ln L_{i}(\theta_{S})] \\ &= 2\left\{ \left[\frac{Y_{i}\theta_{S} - b(\theta_{S})}{a(\phi)} + c(Y_{i}, \phi) \right] - \left[\frac{Y_{i}\hat{\theta} - b(\hat{\theta})}{a(\phi)} + c(Y_{i}, \phi) \right] \right\} \\ &= 2\left[\frac{Y_{i}(\theta_{S} - \hat{\theta}) - b(\theta_{S}) + b(\hat{\theta})}{a(\phi)} \right] \end{split}$$

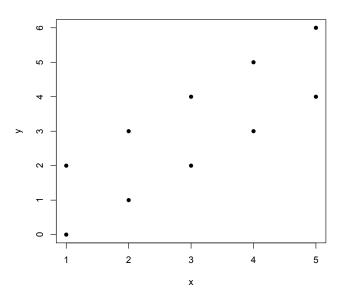

"Deviance" Residuals:

$$\hat{r}_{Di} = \left(\frac{\hat{u}_i}{|\hat{u}_i|}\right)\sqrt{\hat{d}_i^2}$$

Toy Example: Linear-Normal

$$\begin{array}{lll} X & = & \{1,1,2,2,3,3,4,4,5,5\} \\ Y & = & \{0,2,1,3,2,4,3,5,4,6\} \\ & & Y_i & = & 0+1X_i+u_i \\ & & \hat{u}_i^2 & = & 1\,\forall\,i \\ & & & \text{"TSS"} \equiv \sum (Y_i - \bar{Y})^2 & = & 30 \\ & & & \text{"RSS"} \equiv \sum \hat{u}_i^2 & = & 10 \\ & & & & \text{"MSS"} \ / \ \text{"ESS"} & = & 20 \end{array}$$

Better GLM Example: Political Knowledge

- 2008 NES political knowledge
- Identify Speaker of the House, VP, British PM, and Chief Justice
- Y_i = number of correct answers (out of four)

$$f(Y_i, p_i) = {4 \choose Y_i} p_i^{Y_i} (1 - p_i)^{4 - Y_i}$$

$$Y \sim \text{Binomial}(4, p)$$

$$\mathsf{E}(Y_i) = \frac{\exp(\mathbf{X}_i \boldsymbol{\beta})}{1 + \exp(\mathbf{X}_i \boldsymbol{\beta})}$$

GLM Example Data (2008 NES)

```
> summary(NES08[.4:16])
   knowledge
                                            Sev

Signif. codes: 0 *** 0.001 ** 0.01 * 0.05 . 0.1 1
(Dispersion parameter for binomial family taken to be 1)
   Null deviance: 3181.4 on 1359 degrees of freedom
Residual deviance: 2952.9 on 1349 degrees of freedom
  (963 observations deleted due to missingness)
ATC: 4563.1
Number of Fisher Scoring iterations: 4
```

Deviance Residuals:

GLMs: Topics We Won't Discuss

- Generalizations for Overdispersion (binomial)
- Diagnostics (leverage, etc.)
- Joint Mean-Dispersion Models

GLM Extensions: "GGLMs"

- Bias-reduced models (a la Firth 1993)
- "Generalized additive models" (GAMs)
- "Generalized estimating equations" (GEEs)
- "Vector" GLMs (Yee and Wild 1996; Yee and Hastie 2003)

GLMs: Software

- R
- glm (in stats)
- vglm (in VGAM)
- Many, many others
- Stata
 - \bullet glm
